

NOTE-IT · HACKTOBERFEST WEEKEND CHALLENGE

UI Wireframes

Layout sketch for the four screens of NOTE-IT, using the classical conditioning sample notes as the example content.

1. Main screen
2. Notes tab
3. Diagram tab
4. Study Buddy tab
5. Design decisions

Flow: paste notes → Generate → Gemma detects subject → fills template → Notes / Diagram / Study Buddy tabs

1. Main screen

Before generating. Input on the left, empty results area on the right.

NOTE-IT Messy notes in, study-ready notes out. Runs locally on Gemma	
Paste your notes: pavlov - russian physiologist, was studying digestion ... Subject: [Auto v] [Try an example] [* Generate]	<- Paste notes and click Generate to get started

Streamlit pieces

- `st.columns([1, 2])`: left column holds the input, right column holds results
- `st.text_area` for notes, `st.selectbox` for subject
- `st.button` for 'Try an example' and 'Generate'

2. Notes tab

After generating. The input stays on the left; organized notes appear in tabs on the right.

(input stays here)	Classical Conditioning [Psychology template] [Notes] [Diagram] [Study Buddy] KEY TERMS - UCS: triggers a response naturally - CS: neutral stimulus that gains meaning through pairing KEY STUDIES Little Albert (Watson & Rayner, 1920) What: rat paired with loud noise Found: fear generalized to rabbit, fur coat, Santa mask ! Ethics: never deconditioned REAL-LIFE EXAMPLE Phone notification -> stress jolt QUIZ YOURSELF In Little Albert, what was the CS? () Loud noise () White rat () Fear () Crying [Check answer]
--------------------	--

Streamlit pieces

- `st.tabs(['Notes', 'Diagram', 'Study Buddy'])`
- Key Study card: `st.container(border=True)`
- Quiz: `st.radio` for the options + `st.button` to check the answer

3. Diagram tab

Gemma writes Mermaid code; the page draws it.

Streamlit pieces

- `streamlit.components.v1.html(...)` loads Mermaid and draws the diagram
- `st.expander` to show the raw Mermaid code
- Regenerate button: cheap fix when Gemma writes broken Mermaid

4. Study Buddy tab

A chatbot that answers questions using the student's own notes.

[Notes] [Diagram] [Study Buddy]

BOT: Hi! I've read your notes on Classical Conditioning.
Ask me anything, or say "quiz me"!

YOU: whats the diff between UCR and CR?

BOT: Great question! They're the same behaviour (drooling)
but with different triggers. UCR is to food, which is
natural. CR is to the bell, which is learned.

Quick: [Quiz me] [Explain simpler] [Give an example]

[Send]

Ask about your notes...

Streamlit pieces

- `st.chat_message` to show each message, `st.chat_input` for typing
- Keep chat history in `st.session_state` so it survives reruns
- Quick-reply buttons are optional but make the demo smoother

Design decisions

Settle these while sketching.

Quiz: interactive or plain text?

Radio buttons look great in a demo but take more work. A question with the answer hidden in an expander is quicker.

Decision: _____

Quick-reply buttons in the chat?

Optional. Nice for the demo video.

Decision: _____

Regenerate button on the diagram?

Cheap insurance against broken Mermaid output.

Decision: _____

Psychology template

Sections: Key Terms, Key Studies, Real-Life Example, Quiz Yourself. Needed for the conditioning and perception samples.

Decision: _____
